

Description:

This project will allow a user to filter data based on certain parameters. There will be filter options for brewery, region/state, styles, ABV, and a general search field. The results will be beers that meet their filter and/or search parameters.

I have an API key for BreweryDB and will use that as a data source (<http://www.brewerydb.com/developers>).

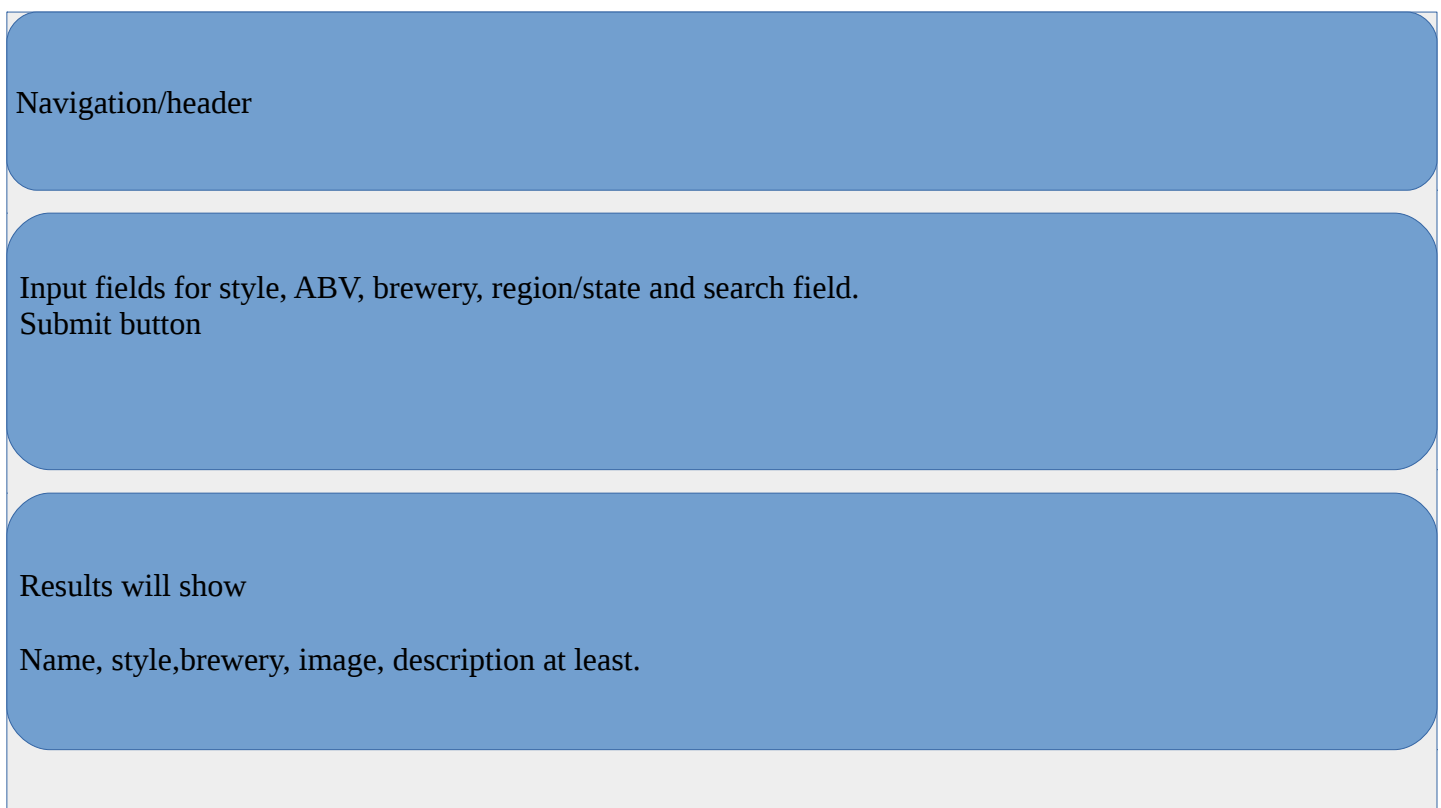

Wireframe:

Initial input of parameters:

This wireframe shows a light gray container with three blue rounded rectangular sections. The top section is labeled 'Navigation/header'. The middle section is labeled 'Input fields for style, brewery, region/state and search field. Submit button'. The bottom section is empty.

After submit:

This wireframe shows a light gray container with three blue rounded rectangular sections. The top section is labeled 'Navigation/header'. The middle section is labeled 'Input fields for style, ABV, brewery, region/state and search field. Submit button'. The bottom section is labeled 'Results will show' and 'Name, style, brewery, image, description at least.'.
